

- 4 Fig. 4.1 shows the variation with extension  $x$  of the tensile force  $F$  for two wires, G and H, made from the same material.

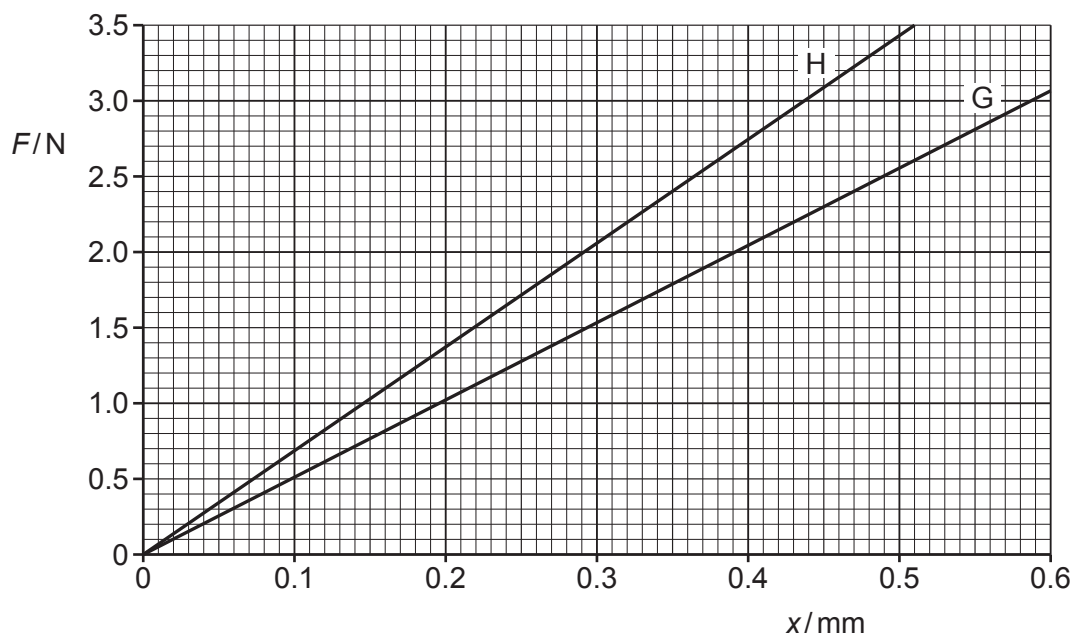

Fig. 4.1

The elastic limit has not been exceeded for G or H.

(a) For the lines in Fig. 4.1:

(i) state what is represented by the gradient

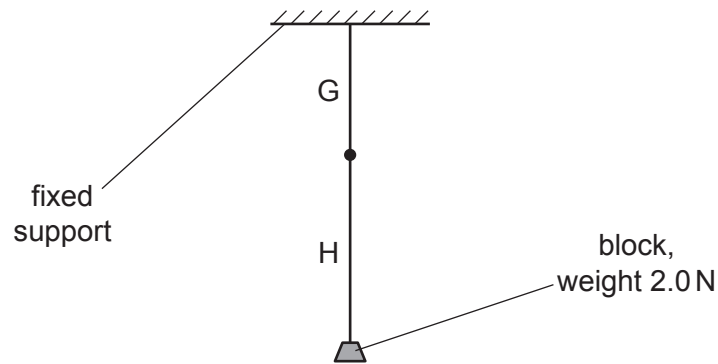

..... [1]

(ii) explain why the area under the line represents the elastic potential energy of the wire.

.....  
.....  
.....  
..... [2]

(b) Wires G and H are joined together end-to-end to form a composite wire of negligible weight. The composite wire hangs vertically from a fixed support.

A block of weight of 2.0 N is attached to the end of the wire, as shown in Fig. 4.2.

**Fig. 4.2**

(i) Use Fig. 4.1 to determine:

- the extension  $x_G$  of wire G

$$x_G = \dots\dots\dots \text{ mm}$$

- the extension  $x_H$  of wire H.

$$x_H = \dots\dots\dots \text{ mm}$$

[1]

(ii) Calculate the total elastic potential energy  $E_p$  of the composite wire due to the weight of the block.

$$E_p = \dots\dots\dots \text{ J} \quad [2]$$

(iii) The original length of wire G is  $L$  and the original length of wire H is  $1.5L$ .

Calculate the ratio

$$\frac{\text{cross-sectional area of wire G}}{\text{cross-sectional area of wire H}}$$

$$\text{ratio} = \dots\dots\dots [3]$$
