

- 6 (a) Three resistors of resistances R_1 , R_2 and R_3 are connected as shown in Fig. 6.1.

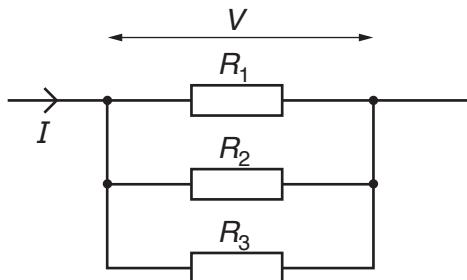

Fig. 6.1

The total current in the combination of resistors is I and the potential difference across the combination is V .

Show that the total resistance R of the combination is given by the equation

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}.$$

[2]

- (b) A battery of electromotive force (e.m.f.) 6.0 V and internal resistance r is connected to a resistor of resistance 12Ω and a variable resistor X , as shown in Fig. 6.2.

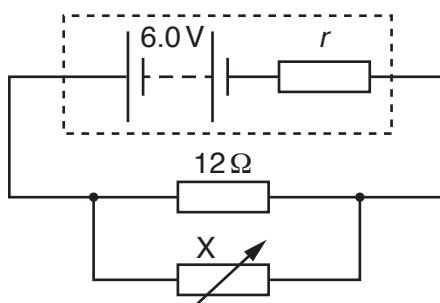

Fig. 6.2

- (i) By considering energy, explain why the potential difference across the battery's terminals is less than the e.m.f. of the battery.
-
-
-

[2]

- (ii) A charge of 2.5 kC passes through the battery.

Calculate

1. the total energy transformed by the battery,

$$\text{energy} = \dots \text{J} [2]$$

2. the number of electrons that pass through the battery.

$$\text{number} = \dots [1]$$

- (iii) The combined resistance of the two resistors connected in parallel is 4.8Ω .

Calculate the resistance of X.

$$\text{resistance of X} = \dots \Omega [1]$$

- (iv) Use your answer in (b)(iii) to determine the ratio

$$\frac{\text{power dissipated in X}}{\text{power dissipated in } 12\Omega \text{ resistor}}$$

$$\text{ratio} = \dots [2]$$

- (v) The resistance of X is now decreased. Explain why the power produced by the battery is increased.
