

10(a)	wavelength of maximum intensity is inversely proportional to (thermodynamic) temperature	B1
10(b)(i)	$\lambda_{\text{MAX}} = 0.50 \text{ } \mu\text{m}$ for A and $0.65 \text{ } \mu\text{m}$ for B	C1
	$T = 5800 \times (0.50 / 0.65)$ $= 4500 \text{ K}$	A1
10(b)(ii)	(star B has) greater peak / average wavelength	B1
	(star B looks) redder	B1
10(c)(i)	apparent wavelength is greater or wavelength is greater than known value	B1
	(due to) movement of star away (from observer)	B1
10(c)(ii)	by examining the (lines in the) spectrum (of light from the star)	B1
	and comparing with known spectrum	B1
