

7(a)	wavelength associated with a <u>moving</u> particle	B1
7(b)(i)	(electron) diffraction	B1
7(b)(ii)	beam spreads out indicating diffraction or light and dark regions indicate an interference pattern	B1
	electron beam is behaving as a wave	B1
7(c)(i)	central blob and concentric rings	B1
	rings closer together (than previously)	B1
7(c)(ii)	(greater p.d. so) electrons to have greater momentum	B1
	greater momentum so decrease in (de Broglie) wavelength	B1
	lower (de Broglie) wavelength (for same grating spacing in crystal) causes: smaller diffraction angle or smaller angle of intensity maxima (for each order) or decrease in fringe spacing in diffraction pattern	B1
