

6(a)	$n\lambda = d\sin\theta$	C1
	$n = (3.8 \times 10^{-6} \times \sin 90^\circ) / (520 \times 10^{-9})$ (= 7.3)	C1
	number of bright fringes formed = 15 (given as an integer)	A1
6(b)(i)	(frequency of red light is) less (than frequency of original light)	B1
6(b)(ii)	(red light has) longer wavelength	M1
	(so) number (of bright fringes formed) is less / fewer (bright fringes are formed)	A1
