

6(a)(i)	PQRS and WXYZ	B1
6(a)(ii)	force on charge carriers is perpendicular to both (magnetic) field and current	B1
	as charge carriers are deflected to one side, an electric field is set up	B1
	(steady V_H when) electric and magnetic forces on charge carriers are equal (and opposite)	B1
6(b)(i)	n : number density of charge carriers	B1
	t : distance PW (or SZ or QX or RY)	B1
	q : charge on each charge carrier	B1
6(b)(ii)	V_H inversely proportional to t	B1
	(so t needs to be small for) V_H to be large enough to measure	B1
