

13 (a) (photons of) electromagnetic radiation emitted from nuclei	M1	A1 [2]
(b) line of best fit drawn recognises μ as given by the gradient of best-fit line or $\ln C = \ln C_0 - \mu x$	B1	B1
$\mu = 0.061 \text{ mm}^{-1}$ (within $\pm 0.004 \text{ mm}^{-1}$, 1 mark; within $\pm 0.002 \text{ mm}^{-1}$, 2 marks)	A2	[4]
(c) aluminium is less absorbing (than lead) or gradient of graph would be less	M1	
so μ is smaller	A1	[2]
