

5	(a) (i) distance (of point on wave) from rest / equilibrium position	B1	[1]
	(ii) distance moved by wave energy / wavefront during one cycle of the source or minimum distance between two points with the same phase or between adjacent crests or troughs	B1	[1]
	(b) (i) $T = 0.60 \text{ s}$	B1	[1]
	(ii) $\lambda = 4.0 \text{ cm}$	B1	[1]
	(iii) either $v = \lambda/T$ or $v = f\lambda$ <u>and</u> $f = 1/T$ $v = 6.7 \text{ cm s}^{-1}$	C1 A1	[2]
	(c) (i) amplitude is decreasing so, it is losing power	M1 A1	[2]
	(ii) $\text{intensity} \sim (\text{amplitude})^2$ ratio = $2.0^2 / 1.1^2$ = 3.3	C1 C1 A1	[3]
6	(a) (i) at 22.5°C , $R = 1600 \Omega$ or $1.6 \text{ k}\Omega$	C1
