

5	(a) (i) displacement is the distance from the equilibrium position / undisturbed position / midpoint / rest position	B1	
	amplitude is the maximum displacement	B1	[2]
	(ii) frequency is the number of wavefronts / crests passing a point per unit time / number of oscillations per unit time	B1	
	time period is the time between adjacent wavefronts or time for one oscillation	B1	[2]
(b)	(i) 1. amplitude = 1.5 mm	A1	[1]
	2. wavelength = $25/6$ = 4.2 cm or 4.2×10^{-2} m	C1 A1	[2]
	(ii) $v = \lambda / T$ or $v = f \lambda$ <u>and</u> $T = 1 / f$ $T = 4.2 / 7.5 = 0.56$ s	C1 A1	[2]
(c)	(i) progressive wavefront / crests moving / energy is transferred by the waves	M0 A1	[1]
	(ii) transverse the vibration is perpendicular to the direction of energy transfer / wave velocity or travel <u>of the wave / wavefronts</u>	M0 A1	[1]
