

- 11 (a)** change/increase/decrease anode/tube voltage B1
 electrons striking anode have changed (kinetic) energy/speed B1
 X-ray/photons/beam have different wavelength/frequency B1 [3]
- (b) (i)** $I = I_0 e^{-\mu x}$ B1 [1]
- (ii)** contrast is difference in degree of blackening (of regions of the image) B1
 μ (very) similar so similar absorption of radiation (for same thickness) so little contrast A1 [2]
