

13	(a)	advantage: e.g. shorter time delay greater coverage over a long time	B1	
		disadvantage: e.g. satellite needs to be tracked more satellites for (continuous) coverage/communication <i>(any sensible suggestions)</i>	B1	[2]
	(b)	(i) frequencies linking Earth with satellite	B1	
		6 GHz is uplink frequency } 4 GHz is downlink frequency } <i>(allow vice versa)</i>	B1	[2]
	(ii)	<i>either</i> signal from Earth to satellite is attenuated greatly <i>or</i> downlink must be amplified greatly before transmission	B1	
		downlink would swamp uplink unless frequencies are different	B1	[2]
